

GEONAP

Wake Up Where You Need To — Not When

The alarm that knows where you're going, so you can finally relax on the way there.

For Commuters, Travelers & Anyone Who Naps On
the Move

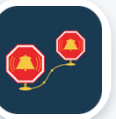

THE PROBLEM

Falling Asleep Feels Risky When You're Traveling

- **You can't count on the station.** Broken departure boards, garbled PA announcements, or signage in a language you don't read make it easy to miss your stop.
- **Staring at a map isn't restful.** Watching a blue dot inch toward your destination defeats the point of dozing off.
- **Time-based alarms don't know your trip.** Traffic, delays, and stops all change your real arrival time — a clock alarm can't adjust.

GeoNap replaces the clock with your location — the alarm that actually knows where you're going.

HOW IT WORKS

Set It Once. GeoNap Takes It From There.

1

Pin Your Stop

Drop a pin on any address, station, or transit stop — or search for it by name.

2

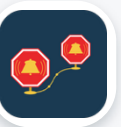

Nap, Ride, Relax

GeoNap quietly tracks your location in the background — no need to keep the app open.

3

Wake Up Right On Time

A full-screen alarm fires the moment you arrive or leave — it cuts through silent mode.

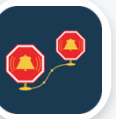

CREATING AN ALARM

Pin a Spot, or Pick a Transit Stop — Your Choice

- **Location Alarm** — search any address or drop a pin anywhere in the world, down to exact GPS coordinates.
- **Transit Alarm** — pick your agency, route, and stop from live schedules — no coordinates needed.
- **Radius, your way** — a simple slider sets how close you need to be before the alarm fires.
- **Save in seconds** — name it, choose arrival or departure, and you're covered for every future trip.

Up to 20 active alarms at once — plenty for a daily commute plus every stop on a trip.

Travel Like Someone's Watching Your Stop For You

Nap Without Worry

Close your eyes knowing GeoNap will wake you at your stop, every single time.

Never Miss Your Stop

GeoNap runs on your phone's own location, not the station's screens or speakers — broken displays, garbled announcements, or signs in a language you don't read don't matter.

Keep Others in the Loop

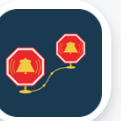

Auto-Notify texts friends, family, or coworkers the moment you leave or arrive — so they always know where you are on the trip, without you lifting a finger.

See It All at a Glance

Every alarm shows its trigger, radius, and status right on the home screen.

SMARTER EVERY TRIP

Features That Work Quietly in the Background

Calendar Scanning

GeoNap scans your calendar for upcoming trips and suggests alarms — you choose which to add.

Hands-Free with Siri

“Create a GeoNap” sets an alarm using just your voice — no typing required.

Run Any Shortcut

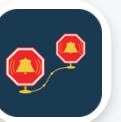

Trigger a Shortcut when you arrive — lights and heat, a text to family, even a remote car start.

Built for CarPlay

Alarms appear right on your car's screen for any passenger riding along.

USE CASE

Train & Subway Commuters

USE CASE

The Daily Commute, Finally Restful

Set an alarm at your station once. Every morning, doze off the moment you sit down — GeoNap wakes you just before you arrive, automatically, without setting anything twice.

Repeating alarms reset automatically after each trip, so the same alarm is ready again tomorrow.

USE CASE

Arriving Home

USE CASE

Walk Into a Home That's Already Ready

As you approach your stop, GeoNap wakes you and can run any Shortcut at the same moment — lights on, thermostat set, and everything ready before you walk in the door.

Powered by any Shortcut you build — HomeKit scenes, a text to family, even a remote car start, any application that support Apple shortcuts. GeoNap just needs its name.

USE CASE

Bus Riders

USE CASE

Never Miss the Bus Again

Set a departure alarm at your home stop. GeoNap fires the moment you leave the area — a built-in reminder to head out, right when you need it.

Choose On Departure as the trigger, and pair it with a comfortable radius for your stop.

USE CASE

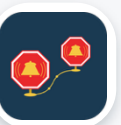

Road Trip Passengers

USE CASE

Ride Along Without Watching the Map

Set an alarm at a waypoint city or your final destination. You'll be notified the moment the car gets close — so you can read, nap, or chat instead of tracking every mile.

Time-based triggers can even wake you a set number of minutes before arrival, based on your current speed.

USE CASE

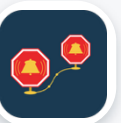

Travelers Abroad

USE CASE

Confidence in Any New City

Set alarms at your hotel, airport, or meeting locations so you always know the moment you're getting close — even somewhere you've never been.

GeoNap works fully offline for standard alarms, and is available in 13 languages.

USE CASE

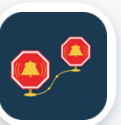

Family & Friends

USE CASE

Know They're On Their Way — and Home Safe

Turn on Auto-Notify for any alarm and the people who care get a text the moment you leave and the moment you arrive — a parent tracking a teenager's commute, or family waiting to hear you landed safe.

Auto-Notify fires on both On Departure and On Arrival triggers, so both ends of every trip are covered automatically.

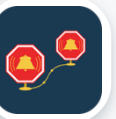

Two Ways an Alarm Knows When to Fire

- **Distance** — fires the moment you cross a set radius from your pin. Ideal for a fixed stop like a single station.
- **Time before arrival** — fires a set number of minutes before you get there, based on your travel speed — perfect for “wake me 5 minutes before my stop.”
- **Every radius, adjustable** — 200 m suits a single station; 500–1,000 m gives extra time near a town center or airport.

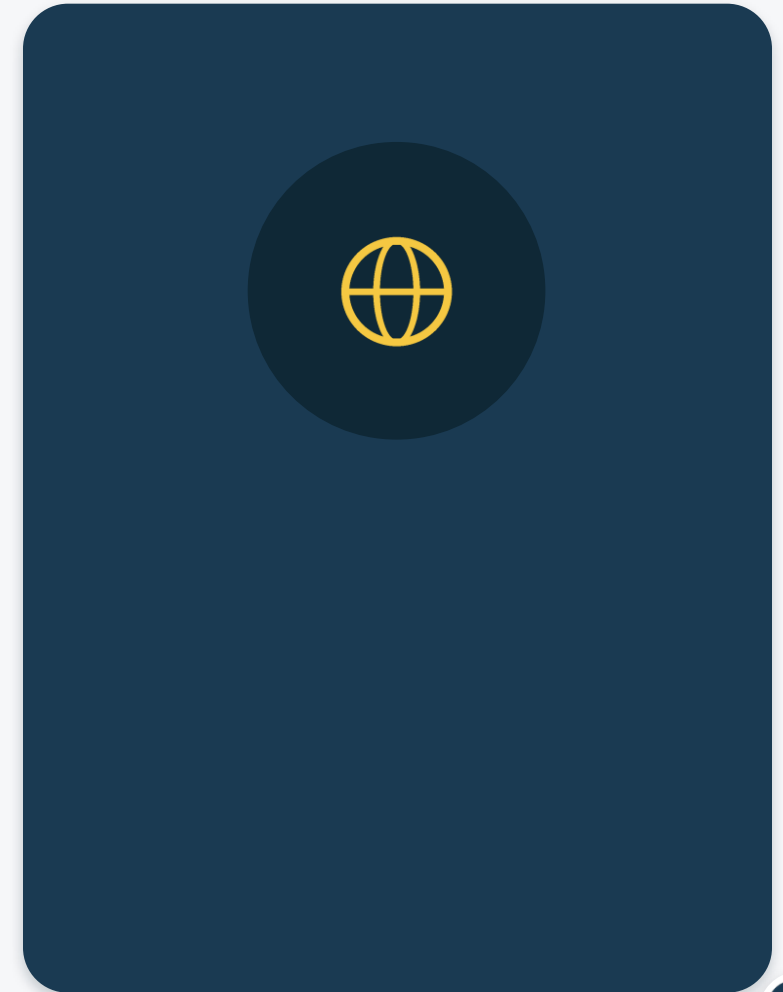

Time mode is ideal for napping on a train or bus — it adapts to how fast you're actually moving.

GO ANYWHERE

Worldwide Transit, In Your Language

- **Preloaded agencies** — Amtrak, BART, MBTA, CTA, GO Transit, and more, ready out of the box.
- **Any public feed** — add any transit agency worldwide with a public GTFS feed URL.
- **13 languages** — English, Spanish, French, German, Italian, Portuguese, Arabic, Hindi, Japanese, Simplified Chinese, Russian, Thai, and Vietnamese.
- **Bundled travel sounds** — boat horn, cable car bell, steam train, sailboat bell, airplane landing, airport chime, or vibrate only.

BUILT ON TRUST

Your Location. Your Calendar. Your Control.

Calendar data is read entirely on your device and never uploaded or shared.

- Calendar Scanning is off by default — you turn it on, and you choose which calendars to include.
- Every suggested alarm is reviewed by you first; nothing is added automatically.
- Full disclosure of how location data is handled is always one tap away in Settings.

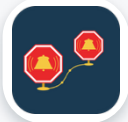

AVAILABILITY

Where GeoNap Runs

Device	Requirement
iPhone	iOS 26.0 or later
iPad	iPadOS 26.0 or later
Apple Watch	watchOS 26.0 or later (companion features)
Connectivity	Offline for standard alarms; internet needed only for transit feed downloads

Location Services must be set to Always so alarms can fire in the background.

Never Miss Your Stop Again

Set your first location alarm in under a minute — and nap the whole way there.

[Download GeoNap \(iOS device\)](#) **

** GeoNap is available in test mode only. As such, Apple requires installation of an app [“TestFlight”](#) on their local iOS device. GeoNap installation, upgrades and feedback is done using the TestFlight application.
